TC is...

Modular

We use the true definition of the term modular; product which is composed of separate or separable elements. With these separate or separable elements we can achieve many different clamping solutions. The only different component of these clamping solutions is the base. The base length determines the clamping capacity while all other components remain the same. Fixed and movable vise jaws can be used with any base configuration, offering the most flexible workholding solutions available. This modular system allows the user to realize the maximum number of workholding combinations with the minimum investment in equipment.

Precision

All sliding and joining surfaces are precision ground. Each item is thoroughly inspected and tested both before and after assembly. This rigid quality control allows us to offer the high tolerance levels shown on page 47. Alignment of the clamping equipment is ensured by using high tolerance ground keys. Other key dimensions are available upon request. The clamping jaws pull the workpiece down 0.2 mm. (0.008") against the ground base for unmatched accuracy.

Durability

All components are constructed from oversize steel profiles ensuring the equipment is exceptionally sturdy and can provide the user with optimal performance. Wear parts are special treated to achieve a surface hardness of 50/60 HRC. All non-ground surfaces are burnished to protect against corrosion.

Quick-change

A patented system allows quick repositioning of the clamping jaws. The clamping jaw is lifted slightly from the base and shuttled to the next clamping position then lowered into place. Part changeovers and size changes can be made quickly and easily.

Reliable

The six bolts mounting the fixed jaw to the base provide the most rigid platform possible to support the clamped workpiece.

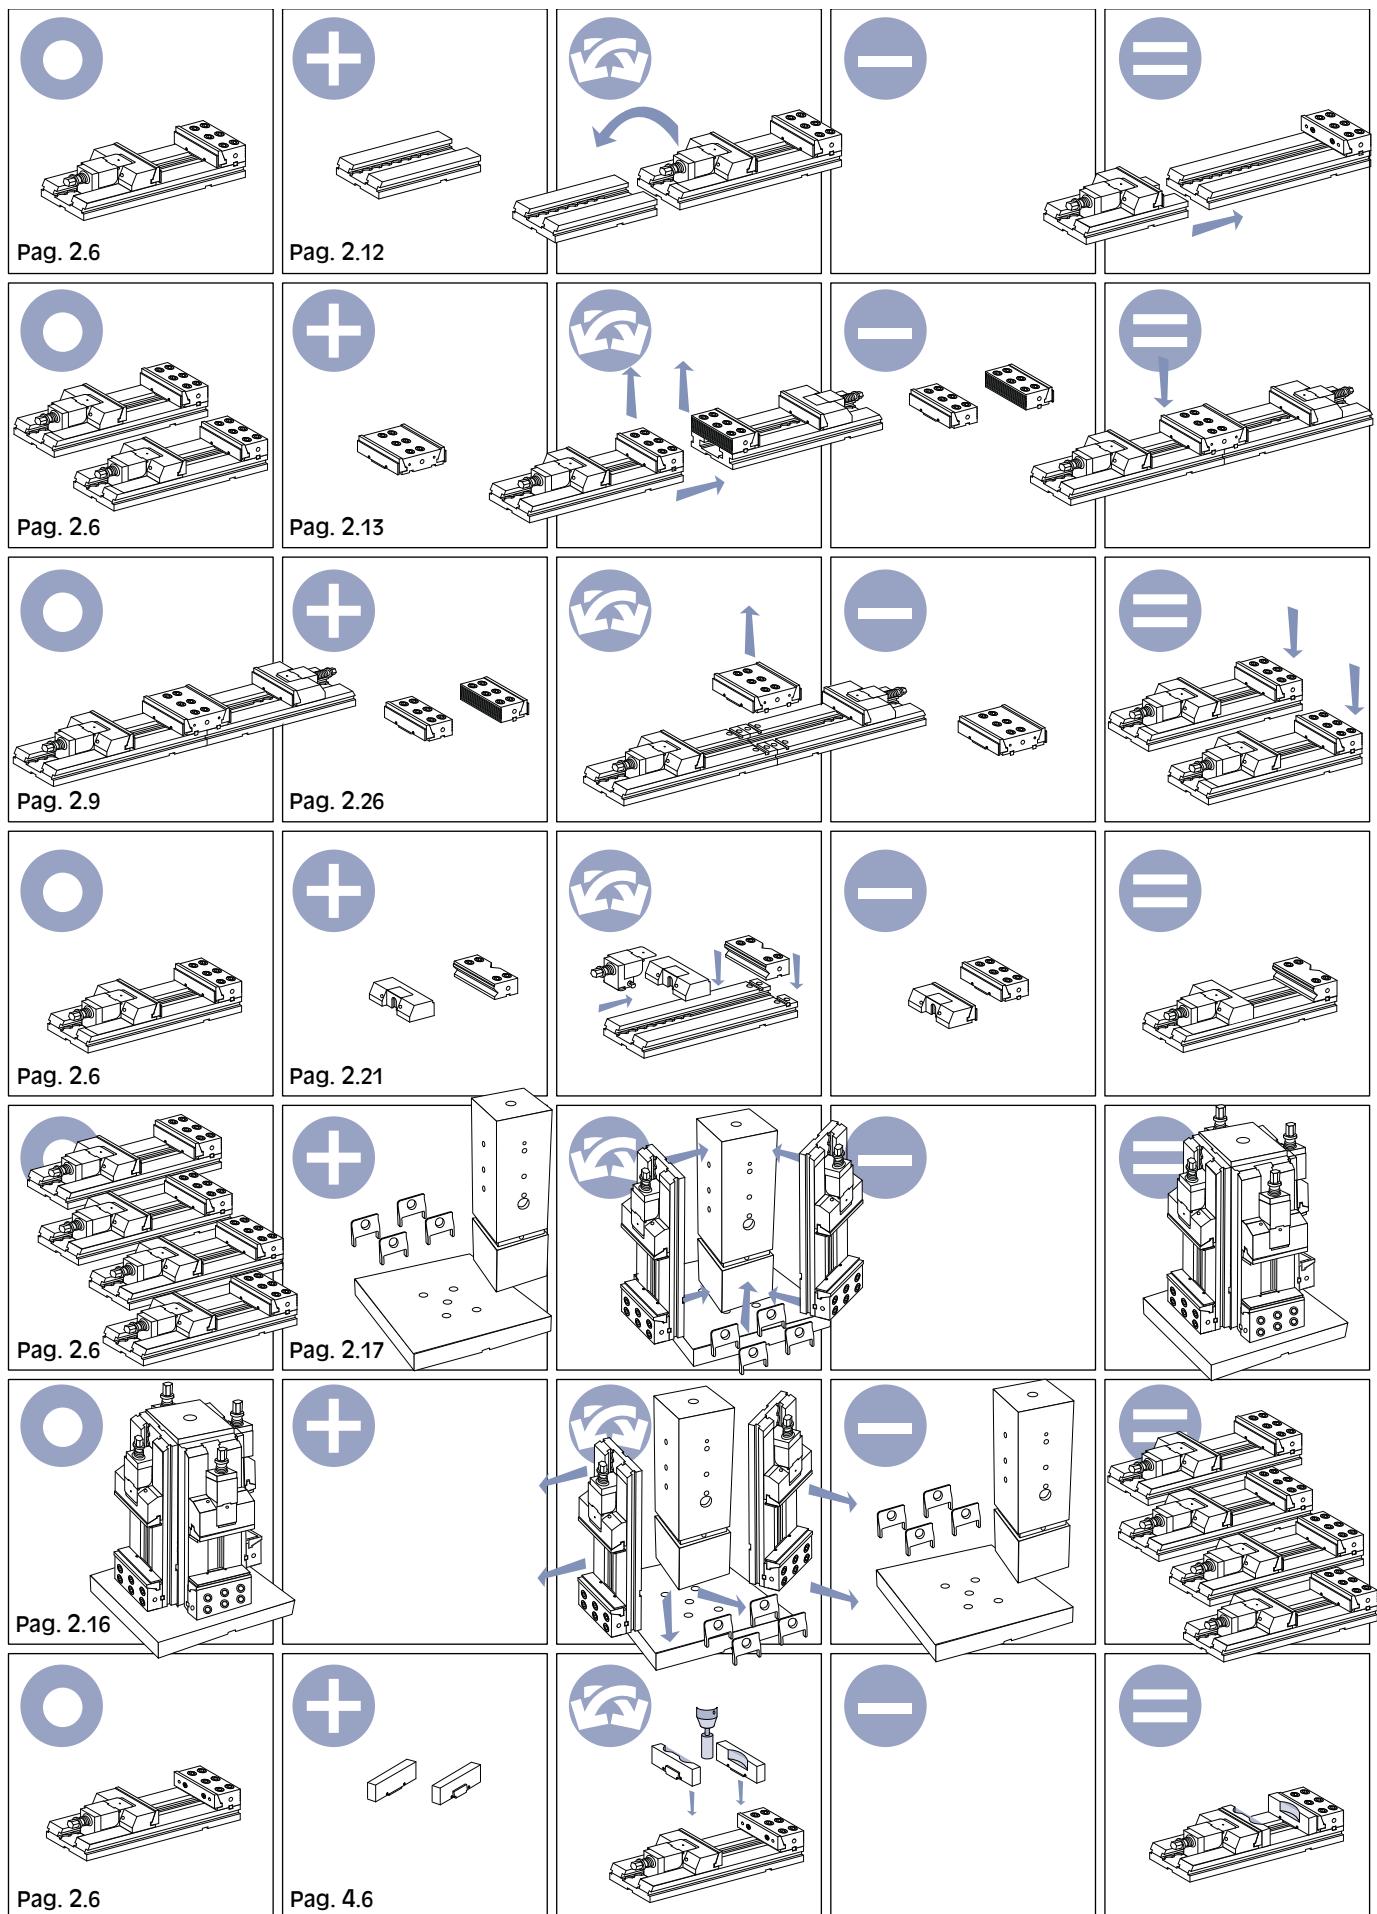

Versatility

The fixed jaw has serrations on the rare face so that by reversing it, unmachined workpieces can be clamped. The movable jaw can be rigid or floating (for clamping on uneven surfaces). The interchangeability of the rigid slide-way with the floating slide-way (both included as standard equipment) allows the user to clamp finished or raw workpieces. The standard CLAK system allows the quick-change of parallels, angular parallels, soft jaws and "V" jaws in order to machine any workpiece.

Manageable

The weight of 27 kg (59 lb.) for the 150 mm. x 200 mm. (6"x 8") vise and simple clamping system allow for easy movement from one machine tool to another.

The advantages of modularity

TC & SinterGrip

SinterGrip: the New Choice

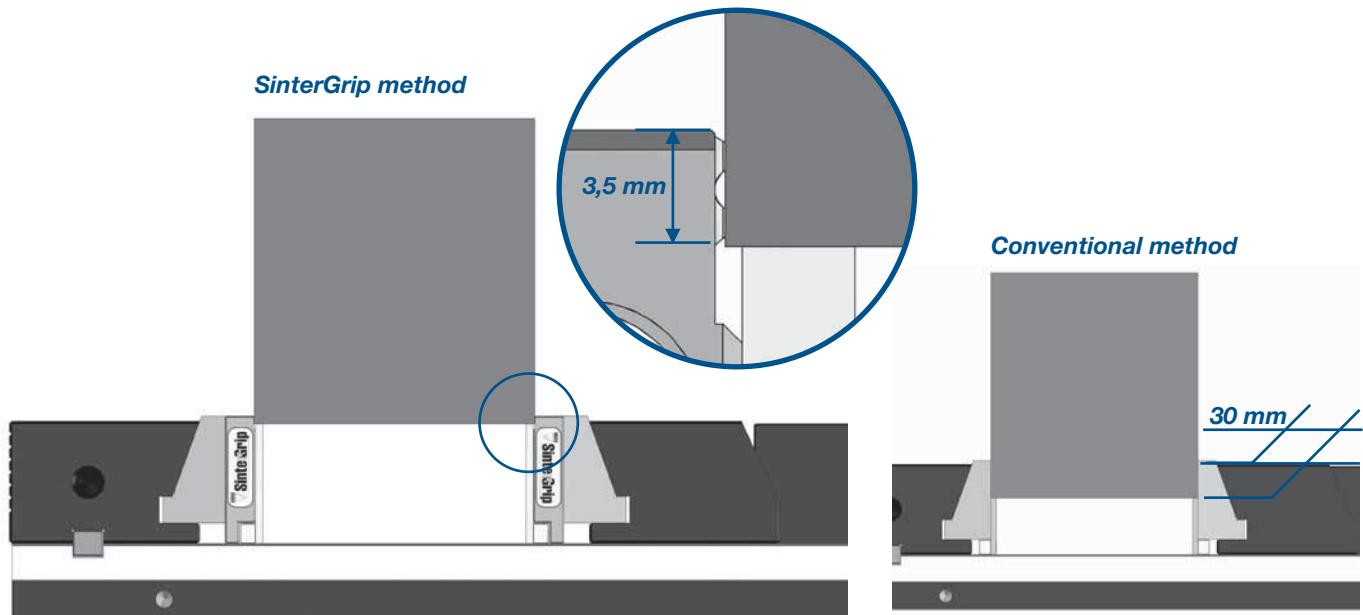

Our new patented product **SinterGrip** is born to satisfy the current need to clamp a workpiece for very few millimeters (with SinterGrip 3,5 mm clamping surface), and this for the following reasons:

- 1) In order to machine the workpiece completely in a single operation (especially for 5 axis machines);
- 2) In order to save money for the raw materials, especially when they have a big impact on the price (aluminum, titanium, etc.)

Indirectly to these reasons, and in order to improve the performance of the machine tool and the tools

**higher cutting speed + higher feed rate =
bigger volume of metal removed =
less time to machine the workpiece**

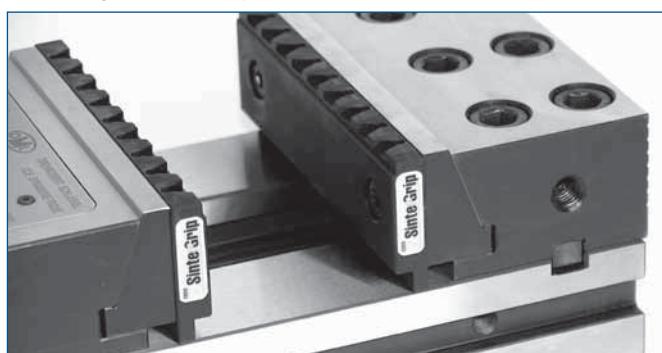

the market requires safe clamping, which could at the same time possibly avoid the deformations of the piece itself.

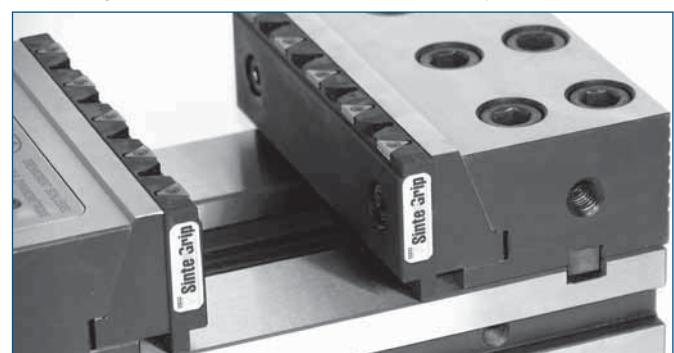

Only 3,5 mm clamping surface, no need of pre-machining the workpiece, clamping stability, higher cutting rate: SinterGrip brings only advantages compared to the traditional systems.

On the contrary, traditional systems need, for the clamping of the workpiece, a bigger clamping surface, with the result of waste of raw materials and greater possibility of deformation of the workpiece.

Working example: jaws mounted on a TC Vise

Working example: with inserts SinterGrip mounted.

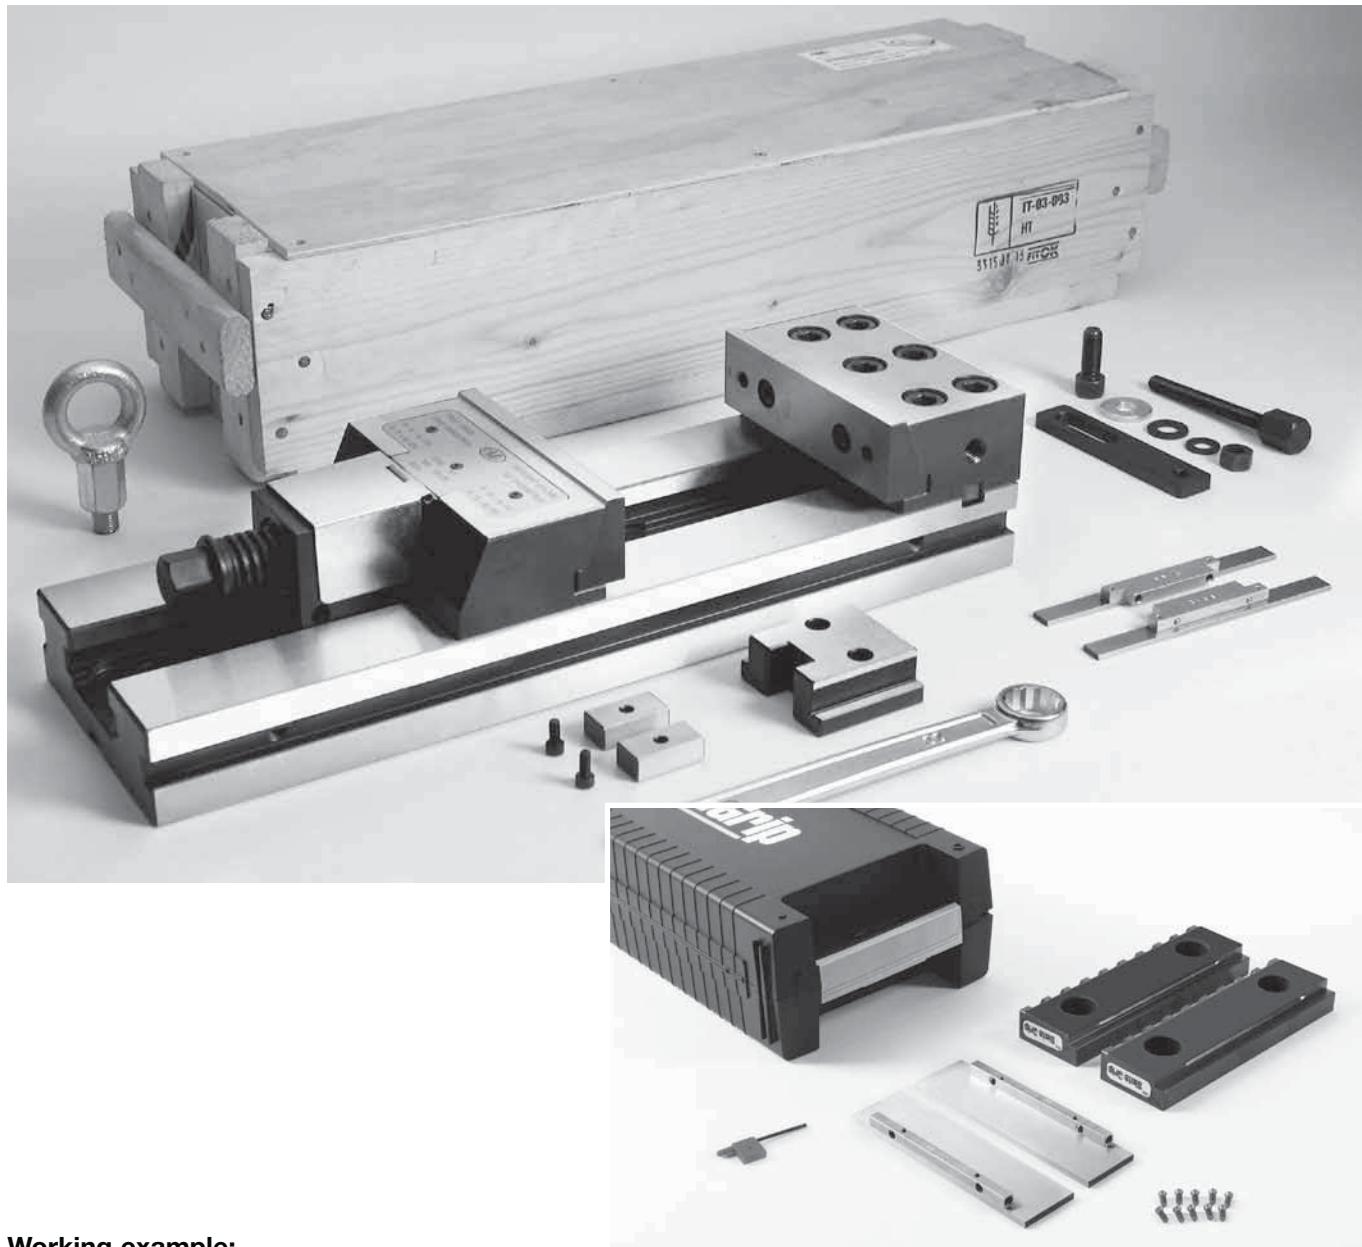

TC & SinterGrip

2

The company policy from OML has always been to seek the best solution for the customer, developing and updating all our products with the latest technologies available.

In this sense, the modular vises of the TC series will now be supplied with: **pair of jaws without tungsten carbide coating, 1 pair of parallels, 1 T9 TORX wrench and 1 kit of 10 screws**, which allow to assemble the latest products **SinterGrip** also on this series.

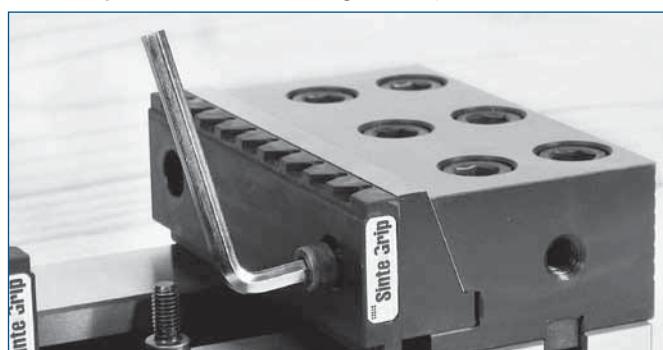

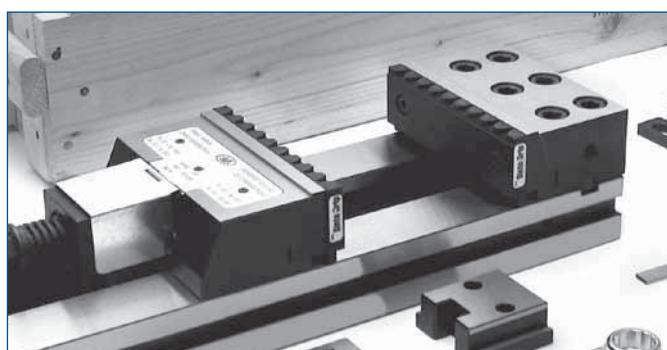

Working example:

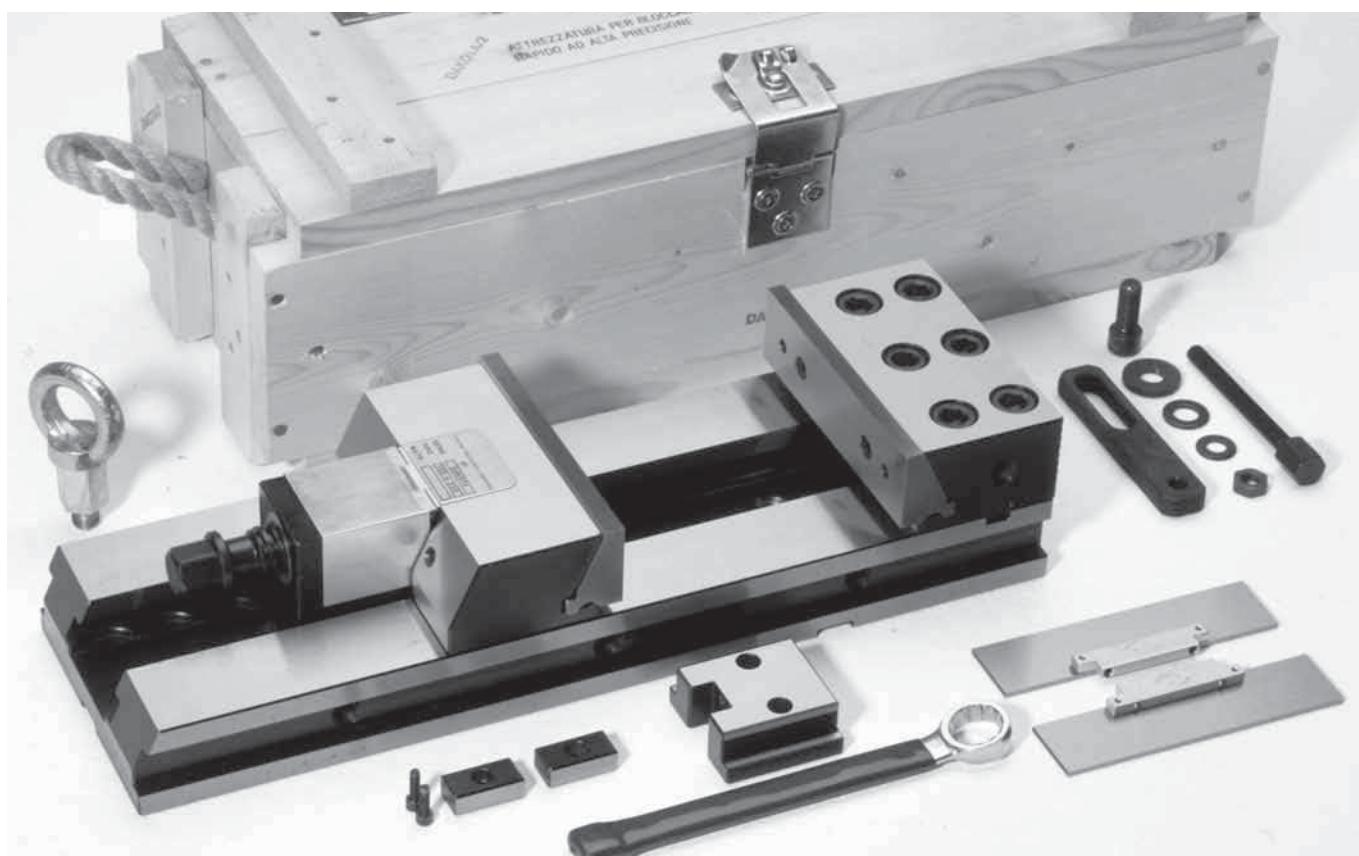

jaws mounted on a TC vise.

SinterGrip inserts are not included:

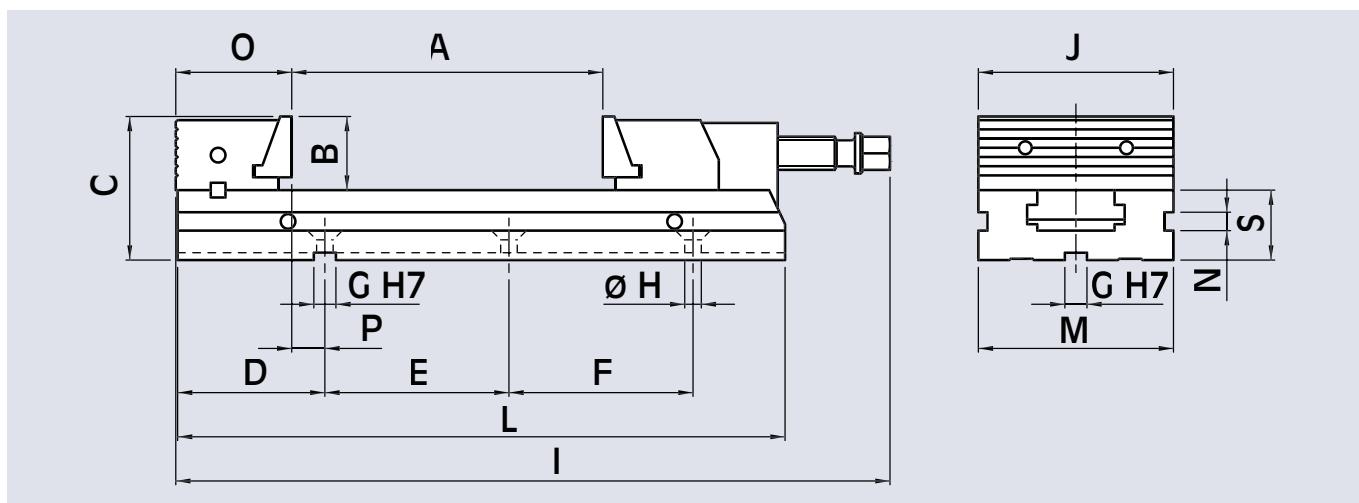

ask to your local dealer.

Working example: mounting of the jaws.

Clamping equipment **Tct** complete with wrench, work stop, rigid slide way, floating slide-way (for raw work-piece), pair of positioning keys, pair of **CLAK** parallels, cover for the protection of the screw, eye bolt for lifting, wooden packing case.

Working examples:

The modularity of the system combined with some other components offers many additional clamping solutions.

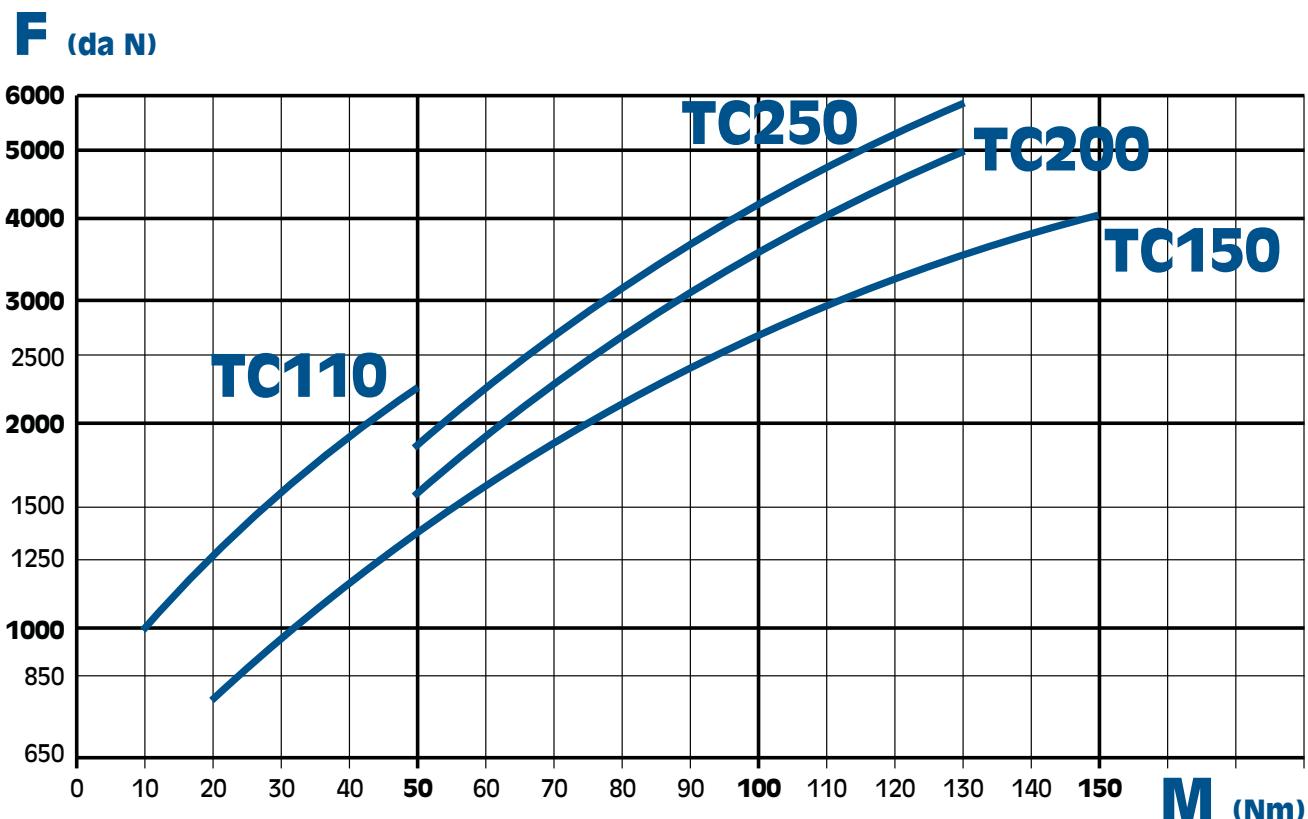

Operating instruction

Clamping the workpiece

For controlled clamping and the best repeatability use of a torque wrench is recommended:

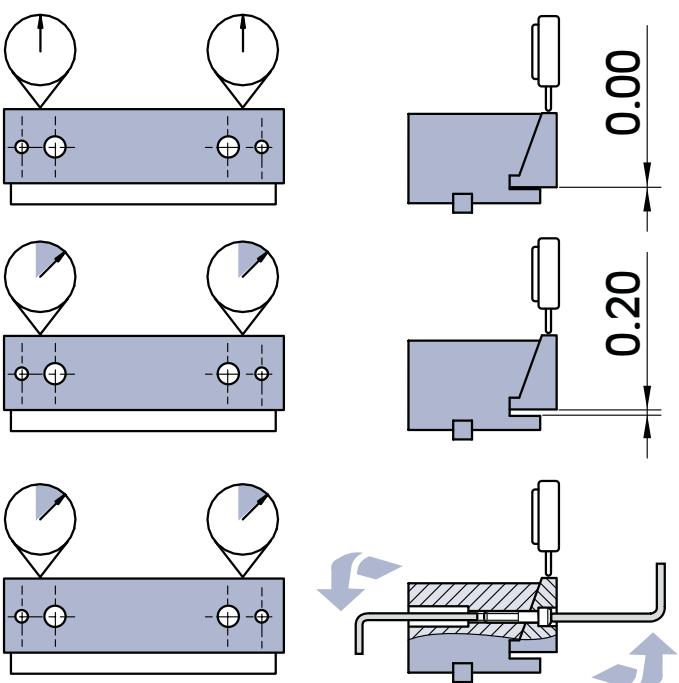

- 1 clamp the workpiece with the torque wrench at the necessary clamping force in accordance with the following diagram
- 2 Zero set on the workpiece
- 3 Machine the first workpiece
- 4 Clamp the other workpieces at the same clamping force

Jaw alignment

When it is necessary to replace the jaws in order to ensure the best part pull-down, we recommend the following steps:

- 1) make sure the jaws are properly secured to the support.

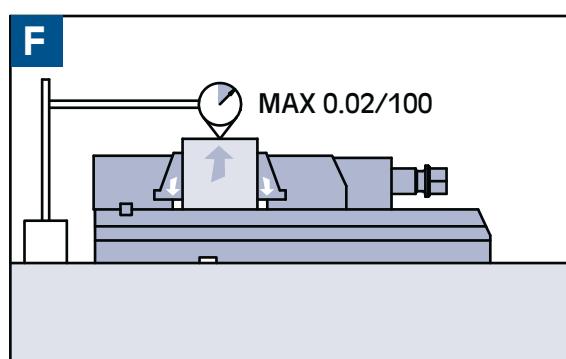

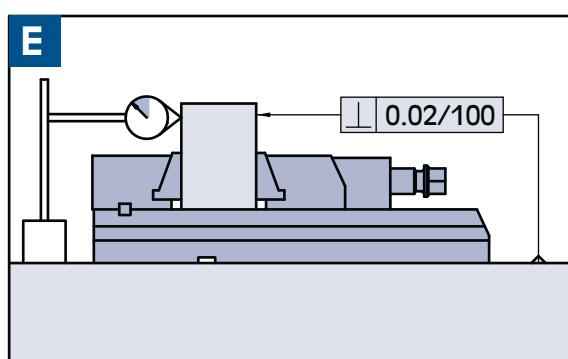

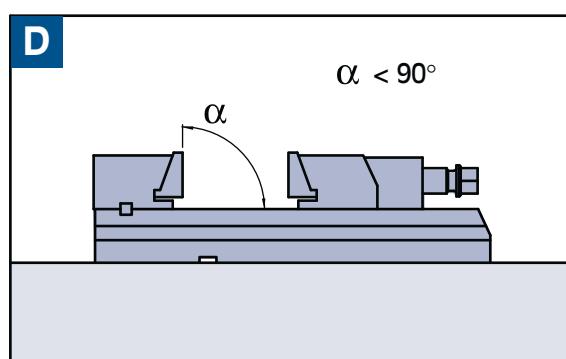

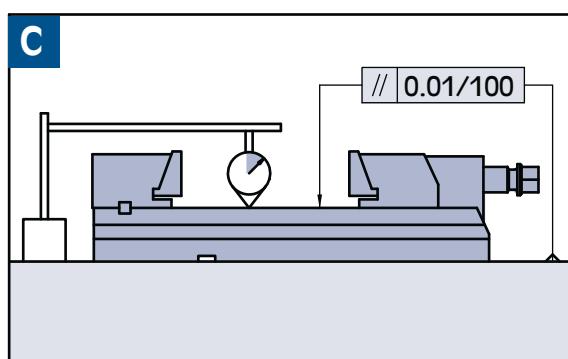

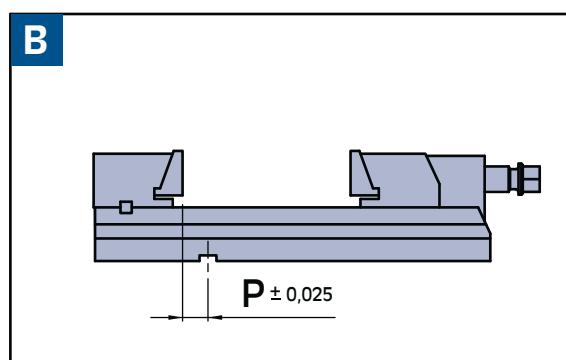

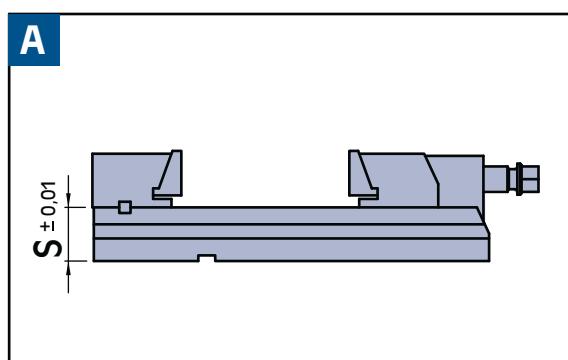

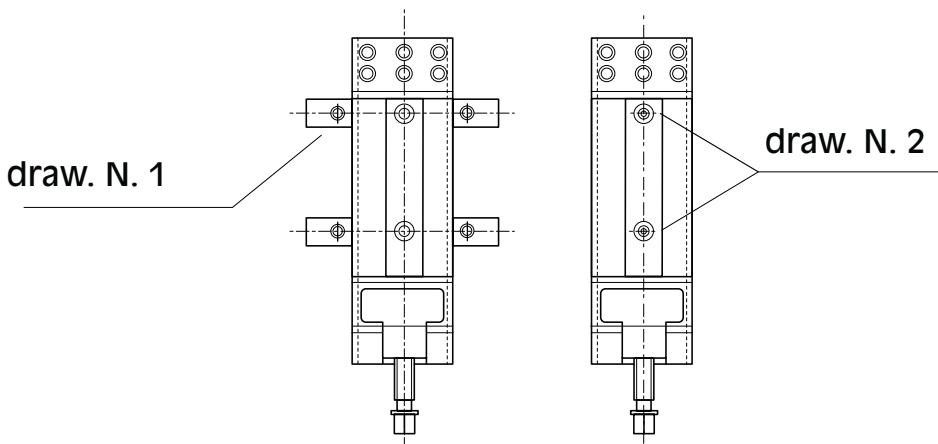

- 2) loosen the adjustment screws until the jaws are backed off about 0.2 mm. (0.008") tighten the lock nuts located on the back side of the support in the opposite direction of the adjustment screws

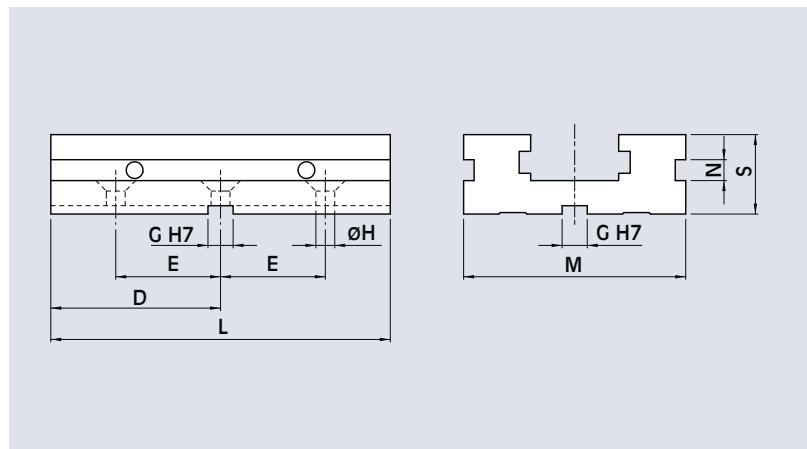

manufacturing tolerances

How to clamp the vises at the table of the machine tool.

In order to obtain a perfect clamping of the workpiece and in order to obtain the tolerances of which point "E" is necessary to clamp the vise on the table of the machine tool by means of the ORIGINAL OML'S CLAMPS (Ex cod. 58022795 see drawing n. 1).

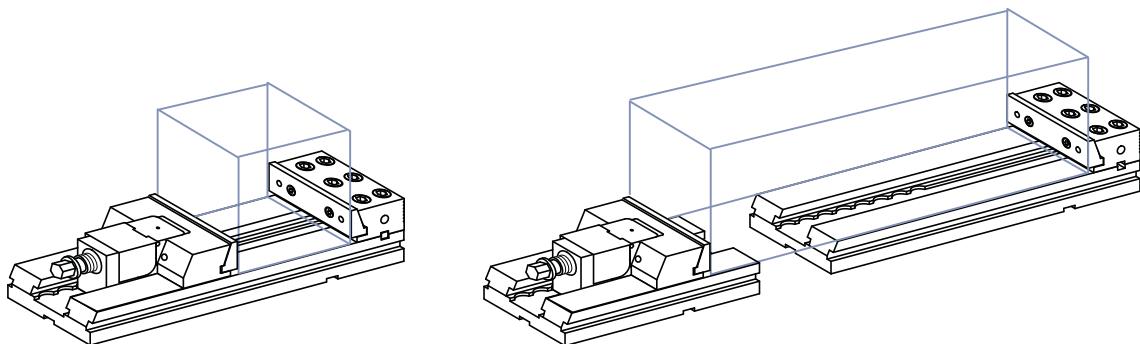

Or by means of the T-nuts (58022595 see drawing n. 2)
